

# RuStore SQL Database Project

An educational SQL database project for the RuStore online store.

The project demonstrates relational database design, table relationships, integrity constraints, test data, and analytical SQL queries.

## Tech Stack:

- MySQL 8+
- SQL DDL / DML
- ERD diagram

## Database Entities:

| Table       | Purpose                                                    |
|-------------|------------------------------------------------------------|
| users       | Stores customer information for the online store.          |
| categories  | Stores product categories.                                 |
| products    | Stores products, prices, categories, and stock quantities. |
| orders      | Stores customer orders and their statuses.                 |
| order_items | Stores the products included in each order.                |
| payments    | Stores payment details for each order.                     |
| deliveries  | Stores delivery information for each order.                |
| reviews     | Stores customer reviews and product ratings.               |

## Project Files:

| File                | Description                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------|
| create_database.sql | Creates the rustore database and selects it for further use.                                        |
| schema.sql          | Creates all database tables and defines relationships between them using foreign keys.              |
| insert_mydata.sql   | Inserts sample data into the database tables.                                                       |
| popular_queries.sql | Contains analytical SQL queries for products, orders, customers, sales, stock levels, and statuses. |
| views.sql           | Creates saved SQL queries as views, such as order totals and product sales statistics.              |
